Abstract: *This article discusses how the system of improving the educational process based on advanced tools, methods, techniques, techniques.*

Keywords: *technical, informational, audiovisual active citizenship, responsibility, responsibility, legal awareness and culture, deep worldview, healthy conviction, enlightenment, tolerance, education of spirituality, idealism, refinement.*

Currently, interest in the use of interactive methods and information technologies in the educational process is growing day by day. One of the reasons for this is that until now, in traditional education, students are taught to acquire only ready-made knowledge, while the use of modern technologies teaches them to independently search for acquired knowledge, independently learn and think, analyze, even draw final conclusions. In this process, the teacher creates conditions for the development, formation, acquisition of knowledge and education of the individual and at the same time performs a managerial, guiding function. Today in education there are such disciplines as "brainstorming", "brainstorming", the method of "network", "cinquain", "BBB", "the fifth extra", "6x6x6", "debate", "plot-role-playing game", FGOU HPE, "work in small groups", "rounded snow", "Modern technologies are used, such as "zigzag", "the last word is mine". The process of education includes two interrelated activities - the activity of the teacher and the activity of the student. In the process of education, a student's consciousness is formed, feelings and various abilities develop, ideological, moral, volitional, aesthetic qualities are formed, a system of scientific views on nature and society is formed, his physical strength is

strengthened. In the process of education, the pupil develops behavioral skills and habits that meet the moral requirements of society for the individual. To achieve this, a systematic and systematic impact is carried out on the student's consciousness (in the learning process), on his emotions (in the classroom and in various extracurricular activities), on his will (in the process of organizing activities, managing behavior). When any of this (reason, emotions, will) is overlooked in the process of education, it becomes more difficult to achieve the goal.

The essence and objectives of the purposeful educational process are planned and regulated by the educator.

A) are planned for the purpose of forming or losing any quality of the student.

B) search for sources that serve to nurture or lose these feelings.

C) what and where it is planned to use theoretical and practical resources that serve the purpose.

Currently, the creative use of this heritage is of great importance. Our ancestors attached great importance to the activity of a mentor teaching knowledge. This was one of the main requirements for pedagogical activity.

Abu Nasr Farabi, the great thinker of the Eastern Renaissance, says about smart, wise and witty people: "smart people are those who are virtuous, witty, devoted to useful work, have an excellent talent to discover and invent the necessary; they stay away from bad deeds. Such people are called wise." He believes that "education takes place only in words and training. On the other hand, education is practical work and learning from one's own experience, that is, a given to a business, a profession that consists of the practical skills of this people, this nation. If they are devoted to work, profession, interested in the profession, if this interest fully attracts them to the profession, then they become real lovers of the profession"

Education is a system of improving the educational process, based on advanced tools, methods, technical means, techniques. This system is created by the teacher, serves to link the stages of education and upbringing. His mizmu also includes such tasks as the predestination of the goal, the preparation of forms and means of

education, the planning of classes aimed at mastering the spiritual qualities that are supposed to be formed in the student. Today, with the development of science and technology, human activity is incredibly expanding, and new technologies are emerging. Qualitative changes indicate that new technical, informational, and audiovisual means have now appeared, requiring new techniques and becoming an integral part of the educational process, bringing their own specific features into it, which have turned modern pedagogical technologies into reality. Increases the productivity of the educational process, forms the process of independent thinking of students, increases students' enthusiasm and interest in knowledge, forms their skills and abilities to firmly assimilate knowledge, freely use it in practice. The traditional teaching system can be said to be characterized as informative teaching due to the vision of work based on written and oral word, since the teacher's activity is considered not only as an organizer of the educational process, but also as an authoritative source of knowledge. Instead of a conclusion, there are methods and means, forms of activity, specific customs and traditions, ideas and life experience of the Uzbek people in preparing the younger generation for life. This legacy has served as the basis for many wise scientists in the past.
