

## **EDUCATION, DIGITIZATION AND SOCIAL SUSTAINABILITY**

*Nizamova Zukhra Aribjanovna*

*listener of Banking and finance Academy of Uzbekistan*

*(“Uzbekiston temir yullari” JSC)*

**Annotation.** In today's increasingly developing era, quality education, digitalization, and especially maintaining social stability are becoming one of the urgent problems. The countries of Central Asia have already achieved great heights in the field of education. In this regard, a number of scientists have made great contributions to science. Especially mature thinkers of their time, such as Abu Rayhan Beruni, Abu Ali ibn Sina, Ahmad al-Farghani, Abu Isa Termizi, Abu Nasr Farabi, Musa al-Khorazmi and others, who lived and worked in Central Asia in the middle and end of the 19th century, and their researches are still alive today. Their works are a clear proof of this. Education is a motivating factor for people's understanding of new things and thus their material and spiritual development. I consider it to be the study of the existence surrounding people, all the processes occurring in the environment, as well as the desire to use their knowledge and experience to introduce new technologies that will make people's lifestyles easier, more comfortable and save their time.

**Keywords.** Education, digitization, knowledge-skills, digital economy factors.

In short - education is the basis of all success, the field that evaluates people's spiritual height.

First of all, every person begins to receive education from his relatives and those around him without realizing it. When a person stops learning, he stops developing. A clear example of this is the monuments that were built by people from ancient times through their rich experience, knowledge and skills, and the answer to which remains an enigma.

If a person does not conduct the educational process in harmony with practice, the result of his acquired knowledge will remain unsatisfactory and useless. The educational process is not only a lecture by a person, but also a process in which one's skills are enriched by testing them in practice. As we have seen, in almost many cases, it is easier for those who are engaged in practice to reach higher levels in the field of education.

In the example of our republic, the conditions for the education of the young generation, especially women, are a testimony of the rise of Uzbekistan among the developed countries of the world.

Digitization. At present, the 21st century is the century of technology. Every field is so closely connected with digitization that it is difficult to imagine life without this process.

Digitization is a factor of growth and efficiency. The process of introducing new technologies and thereby reducing the physical labor of people in each field, increasing their mental potential, increasing the efficiency of work, and reducing the time factor. Being that surrounds a person. Especially now terms such as economy and digital technologies are increasing.

Currently, more than 90% of developed and developing countries rely on digital technologies.

As in any field, along with the positive side of the digitization process, it is worth mentioning the negative side.

For example, the process of digitalization limits the human factor, especially in manual labor activities, and this leads to the dismissal of people from their current jobs. In this way, unemployment in the country will increase, it will lead to increase in number of people, hunger and destruction of comfortable lifestyle. In this regard, not only young people who work physically, but also people who are used to the way of life and are close to retirement age will lose their jobs. Also, the increasing development of the digitization process is causing the loss of human feelings (affection, care, sincerity, education). Also, now it is causing the consequences that threaten not only the nation, but the whole world,

security, peace and stability, as well as environmental problems, the destruction of living nature, and the environment. On the positive side, it is a means of bringing distant people closer together. It is important that the terms and processes are getting shorter and shorter in the exchange of information, life events, events and news in a short period of time, processing them and presenting them to the public. It should also be noted that due to digitization, the prices of equipment and technologies are decreasing in appearance, compact, modern, multi-functional, practically inconspicuous, convenient to use.

Briefly speaking about social stability - social stability can be described as a set of efforts to fundamentally change the way of life of people, to develop and improve them.

But no matter how much effort is made, social stability is currently slipping around the world. As a clear example of this, it can be recognized that the peoples of some Asian and African countries lead a socially unstable, poor and miserable lifestyle. Also, the impact of the negative economic-political and ecological environment in the country is significant.

Social stability is a positive way of improving people's lifestyle, the value of time, which is one of the most urgent problems at the moment, serves to increase the standard of living.

So, education, digitalization, social stability are interrelated concepts. Because the expansion and development of the field of education - digitalization process, digitalization, introduction of new technologies is seen as a factor that causes social stability in people's lives.

**Conclusion.** First of all, it can be said that education is an integral part of human nature. A prosperous, productive and useful life of a person depends on the knowledge, skills and experiences he has acquired in life and on his ability to apply them correctly during his work. Knowledge and education are spiritual food for people.

Regarding digitalization, there are many areas that human thinking has not yet been able to perceive. In today's rapidly developing era, people are reaching unprecedented heights in the field of digitization based on their knowledge and experience. But it is

necessary not to forget that along with imparting quality knowledge and skills to the future generation, it is also necessary to inculcate concepts such as humanity, dignity, trust, sense of country, spiritual and moral maturity. It is necessary to study the positive and negative situations affecting the human psyche and health, while not forgetting the spiritual and moral concepts in the implementation of modern technology-technologies regarding digitization. It is not for nothing that some seemingly insignificant invention can lead to the extinction of mankind.

It is worth noting that in order to ensure social stability, to raise people's safety, material and spiritual living standards, and to create suitable conditions for them, it is appropriate to pay attention to maintaining international peace and stability.
