Abstract: Information is communicative in increasing students' vocabulary the use of technology has brought unprecedented progress to the educational system. Information students are in the process of memorizing new words with the help of communication technologies and teachers have the opportunity to learn in a simple way through their images modern technologies were very helpful in attracting the interest of the entire audience.

Keywords: Information and communication technologies, electronic board, computer, laptop, educational materials, technology, foreign languages, vocabulary, modern,technologies.

Main body: It is no secret that learning foreign languages has reached the level of demand today.Currently, children of the period of independence have to learn at least 2 foreign languages.The conditions for this in our motherland are on a large scale. From the moment children enter the 1st grade, with Russian and English they start dating. At the same time, the teaching of these languages continues to the 11th grade is enough during this process, students learn these languages at least up to (B1) level they will have the opportunity to learn. Private schools and higher education in addition, German, French, Italian, Turkish, Arabic, and other languages are taught in institutions languages are taught.

Learning each language requires a certain process. For example, any edge Grammar and vocabulary are very important in learning the language. Grammar these are the rules of sentence structure. Vocabulary is the words of a certain language. We all know that if a person does not have the vocabulary of a certain language, it is there is no significant aspect of using grammar here. In today's technology age, information, and communication technologies are used by everyone managed to find his place in the industry. At the same time, in learning foreign languages the role of information and communication technologies is incomparable. The use of information and communication technologies in the teaching of foreign languages is didactically related to the "visualization" of educational materials, that is, "animation" of it, the ability to make a visual journey, and the ability to imagine events that cannot be shown in other ways. opens opportunities. This allows the learning process to be effective and lively.

The role of information and communication technologies in increasing vocabulary is great. The process of learning new words is not the same for all students. Because among the students, there are also students with slow learning.With the help of information and communication technologies, all students can learn in the same and effective way, because they remember through the use of modern technologies, not simply by translating a certain word, but by describing it. According to scientists, a person remembers 20% of what he hears 30% of what he sees, and more than 50% of what he sees and hears at the same time. Thus, facilitating the process of perceiving and remembering new words with the help of vivid imagery is the basis of any imagery. For example, instead of simply saying the English translation of the fruit "banana", it is more effective to show a picture of the fruit "banana" and the English translation using a computer, laptop, or electronic board. If the audio recording of this fruit is placed at the bottom of the picture, the students will be able to learn how to pronounce this word. This is preferable to the method of teaching new words in the traditional education system. In the traditional education system, handouts are also used to teach words. This method is also very effective. However, the advantage of using information and communication

technologies in teaching new words is the increase in the quality of learning due to the unusual approach and interest in working with a computer. That is why the Ministry of Public Education is carrying out extensive work on equipping general education schools with computer equipment and decommissioning outdated models of computers. For this, credit grants from international financial institutions are being attracted.

Summary: Information on increasing students' vocabulary in foreign languages and the role of technology is important. Through interest in information and communication technologies, students have the opportunity to learn new words quickly and efficiently.
